BARLEY IS ADAPTABLE CROP

Winter Variety Is Valuable for Pasture Purposes

Winter barley, conceded to be the best pasture crop among the grains, should be sown right after the first good rains in August or early September says Bulletin 353, "Winter Barley, A New Factor in Missouri Agriculture," just published by the Missouri College of Agriculture. The authors of this publication are W. C. Etheridge, C. A. Helm and E. Marion Brown of the field crops department of the College.

A hardy variety of winter barley, if sown at the rate of 2 bushels per acre, may be used for pasture from late September until early December, and may again be pastured from late March until May. The combined fall and spring grazing periods of this crop may cover as many as 100 to 125 calendar days. Barley fits well in rotations with other crops and is a particularly favorable nurse crop for legumes and grasses. It makes a thrifty use of soil fertility and is one of the most efficient cover crops for the control of soil erosion during the fall and winter. It can profitably take the place of corn on land medium in fertility.

Winter barley is much the earliest of Missouri grain crops to ripen. The favorite varieties are ready for harvesting in late May or the first days of June, about 2 weeks ahead of rye, 3 weeks ahead of spring barley, 3 to 4 weeks ahead of wheat, and 4 to 5 weeks ahead of oats. Thus, winter barley escapes much of the damage by chinch bugs and spring drought that may be fully inflicted upon later grain crops.

Because the barley crop is harvested so early, the growth of any legume or grass previously sown therein is greatly favored; or, if there is no intersown growth, the land is left free at a timely period for sowing a full-season crop of soybean hay. Barley grain is ready for use in early summer when other grains, especially corn, are scarce and expensive.

Winter barley may be produced by nearly the same standard methods used in growing a crop of wheat. It may be considered as safe a crop as either wheat or oats, if it is correctly handled, and if its partial avoidance of chinch bugs and spring drought is taken into account over a long period.
